

Clinician System Testing Guide

Use this guide before Keycloak is connected.

PRE-KEYCLOAK TESTING

CLINICIAN WORKFLOW

Purpose

This guide helps clinicians validate the current Harmony Health MIS workflow before centralized Keycloak login is configured. Login with existing Harmony MIS credentials. The goal is to test the practical patient sequence: find or register a patient, check them in, capture clinical pre-checks, create a new visit, and record a follow-up.

Login

Old clinician credentials

Find / register patient

Patient list or registration

Check-in / queue

Reception or clinician test

Clinical pre-checks

Consent, history, confidential review, vitals

New visit

Consultation record

Follow-up

Review symptoms and remedy response

Testing rule

Use test patients only. Do not enter real patient confidential information during validation unless the clinic owner has approved that live-data test.

1. Login And Open The Clinician Workspace

The current login remains active until Keycloak is connected.

1

Open the MIS

Go to <https://mis.harmonyhealthsz.com> or the local test URL provided by the administrator.

2

Sign in

Use your current Harmony MIS clinician username and password. Do not use the new Keycloak admin account for MIS testing.

3

Confirm role

After login, confirm that the sidebar shows Clinician dashboard or that clinician patient actions are available.

What to see

A purple Harmony top bar, collapsible sidebar, and menu items such as Patients, Visits, Appointments, Messages, Reports, and Settings.

If login fails

Report the exact username used, time of attempt, and any message shown. Do not reset passwords without admin approval.

2. Find Or Check In A Patient

The check-in interface should identify whether the patient has an appointment or should enter the queue.

1

Go to Patients

Open Patients from the sidebar, then use Patient List to find an existing test patient.

2

Open Check-In

Use the Check-In menu item or patient-specific check-in action when available.

3

Choose identifier

Select Cell Number, Patient ID, or National/Passport ID.

4

Search and confirm

Enter the identifier, verify the patient name, then continue.

5

Choose visit type

Select New Visit or Follow Up. The system checks appointments automatically.

6

Activate flow

The patient should appear as checked in or queued, with a queue number for walk-ins.

Expected result

Patient process tracking should show the current stage and what needs to happen next. A patient should not be activated twice in the same day.

3. Create A New Visit

New visit recording should only be available after required patient workflow steps are satisfied.

Before creating the visit

Confirm the patient has consent completed, is checked in or queued, and has the required clinical pre-checks available. Vitals can be recorded when consent is complete.

1

Open patient workspace

From Patient List, open the test patient.

2

Use New visit

Click New visit from the patient action row. Do not use old case routes.

3

Visit details

Confirm patient, visit type, visit date, and visit time.

4

Symptoms / problems

Add each symptom or problem as a separate line item. Each can later be marked resolved or left open.

5

Clinical sections

Complete medical review sections relevant to the patient. Gender-specific fields should not appear for male patients.

6

Save visit

Save and confirm the visit appears under the patient record tabs.

4. Create A Follow-Up Visit

Follow-up should reuse the previous complaint context without exposing previous diagnosis/remedy by default.

Follow-up logic to verify

The previous complaint/symptom context should be visible. Previous diagnosis, remedy, and recommendations should stay hidden until the clinician uses the view/eye action.

1

Find the patient

Open the same patient used for the new visit test.

2

Create follow-up

Use Follow-up or Add Visit with visit type Follow up.

3

Review symptoms

Open symptoms/problems from the previous visit. Mark resolved items with a tick and leave unresolved items open.

4

Add new symptoms

Add any new problem as a separate item with its own note.

5

Record evaluation

Complete follow-up evaluation fields: previous consult symptoms, dietary changes, lifestyle/exercise, energy, and evaluation notes.

6

Save and verify

Confirm patient history shows both original visit and follow-up records in order.

5. Clinician Test Checklist

Record what passed, what failed, and what needs workflow clarification.

Area	What to verify	Pass / Fail	
Login	Clinician can sign in using old credentials.	☐	☐
Patient search	Existing patient can be found by name, phone, patient ID, or national/passport ID.	☐	☐
Check-in	Check-in/queue creates one active patient flow for the day.	☐	☐
Consent gating	Clinical buttons stay blocked until consent is complete.	☐	☐
New visit	New visit opens from the patient workspace and saves successfully.	☐	☐
Symptoms/problems	Multiple symptoms can be added and individually resolved later.	☐	☐
Follow-up	Follow-up shows prior complaint context and accepts new evaluation notes.	☐	☐
Vitals	Vitals can be captured after consent and linked to a visit/time.	☐	☐
Patient record tabs	Overview, diagnosis, remedies, vitals, follow-ups, documents, and notes display related records.	☐	☐
Errors	Errors appear as clear user-facing messages, not technical traces.	☐	☐

How to report feedback

Send the patient code, action attempted, expected result, actual result, screenshot if possible, and whether the issue blocks real clinical work.
